Metrics for Product Managers

Aaghran Ghosh

Principal Product Manager @ ThoughtSpot | Scaling Generative AI & Natural Language Analytics (Spotter) | 10+ Years of Data & Deep Tech Strategy.

Bengaluru, Karnataka, India

Summary

Hi there! I am a product builder at heart with a decade of experience scaling data-driven B2B platforms from early-stage startups to high-growth enterprise SaaS. My career is rooted in a deep technical foundation—starting as a UI/Web developer—which allows me to bridge the gap between complex engineering and intuitive user experiences. Currently, as a Principal Product Manager at ThoughtSpot, I am leading the evolution of Spotter, our AI-backed analytics assistant. My focus has shifted from diagnostic "Natural Language" search to building Core Agentic Workflows and adopting the Model Context Protocol (MCP) to create autonomous, high-trust analytical systems. Career Highlights: * ThoughtSpot: Spearheading the Agentic UI and Core Agent engine to move beyond "what happened" to "why it happened". * Hevo Data: Directed the integrations portfolio, driving a framework that powered \$5M+ ARR and significantly reduced developer overhead. * Sixt: Rapidly deployed a pandemic-response routing tool in one week, managing €10M+ in reservation revenue. Beyond the roadmap, I am an avid photographer and the creator of wanderingbong.com. I view this brand as my personal sandbox for 'Lyaadh'—the art of intentional, slow living in a high-speed world. It's where I merge my technical roots with my creative passions, experimenting with AI-assisted content workflows, web performance, and visual storytelling to document my travels and the world around me.

Experience

ThoughtSpot

2 years 5 months

Principal Product Manager

September 2024 - Present (1 year 8 months)

Bengaluru

I'm part of the team building Spotter, our AI-powered analytics assistant that helps business users move beyond 'what happened' to uncover the 'why' behind their data shifts.

- Agentic UI & User Experience: Currently working on the design and frontend evolution of the Spotter Agent UI, focusing on creating a seamless interaction model for complex, multi-step agentic workflows.

- MCP Integration & Ecosystem: Worked on ThoughtSpot's adoption of the Model Context Protocol (MCP), enabling Spotter to act as an MCP Host. This allows the agent to securely pull context from external tools (SaaS, local files, and APIs), effectively breaking data silos for a more holistic analytical "brain."

- Core Agent Engine: Transitioned to driving the Core Agent development, focusing on autonomous reasoning and reliability—ensuring the AI can plan, execute, and self-correct its own analytical paths.

- Vibe Analytics (Deep Analysis): Spearheading a new "personal analyst" mode in Spotter that guides users through multi-dimensional data exploration, eliminating the need for manual SQL deepdives or dashboard construction.

Senior Product Manager

December 2023 - September 2024 (10 months)

Bengaluru, Karnataka, India

I worked on our data platform—collaborating with enterprise customers to build secure authentication and integration features like SSO, APIs, and data connectors that enable scalable, compliant deployments.

I contributed to our Data Augmentation capabilities — allowing users to upload their own CSVs and instantly join them to existing reports for on-the-fly analysis. This unlocked a lightweight way to bring external context into existing content without needing complex data engineering.

Hevo Data

Senior Product Manager

June 2021 - November 2023 (2 years 6 months)

My mission with Hevo Data is to create products that make data accessible, reliable, and actionable for everyone.

I manage the integrations portfolio (majorly focusing on database/technical integrations) at Hevo; with a \$5M+ annual revenue.

Key Accomplishments:

- Active participation / drive the product roadmap for the database/technical integrations portfolio.
- Handling top key accounts/leads for relation building for escalations or feedback gathering.
- As part of a Product Initiative to deliver new long-tail integrations in a year, envisioned a new framework to deliver REST-based sources without a developer's involvement, resulting in a significant reduction in developer bandwidth and accelerated time to deployment. This innovation streamlined the integration process and provided the much-needed bandwidth to the Engineering team to focus on High-priority sources instead.
- Collaborate closely with cross-functional teams, including engineering, design, and sales, to ensure alignment with customer needs and business objectives. Actively involved with customer success teams to capture feedback from the users and expand the accounts.
- Actively involved in the hiring process, identifying and recruiting top talent to strengthen the product team and engineering teams.

SIXT Research & Development India

Product Manager

September 2019 - June 2021 (1 year 10 months)

Bangalore

- Conceptualized and delivered a new product for Repair handling for the Sixt fleet. Scaled up the product to handle operations in 6 countries.
- Building products to manage Damage and Repair operations in the Sixt fleet across all geographies
- Handling millions of Euros in revenues and optimizing for higher profits by increasing damage quality and claims. And by reducing out of service duration due to repair and repair costs.
- Routed approximately 100,000 reservations worth ~10mn EUR revenue with a quick tool by routing them to branches that were still open and could fulfill the reservation. We build this in a week, in the initial days of the pandemic to handle the sudden closure of many branches due to the restrictions in Germany and the US. Without the tool, we would have a bad customer experience with SIXT.

ZipGo

Product Manager

October 2018 - August 2019 (11 months)

Bengaluru Area, India

Managed product for Zipgo's new Intercity business; A team of 13 - spanning design, data, engineering & QA.

- Conceptualized, built & launched Zipgo Intercity Platform - spanning web, mobile & native apps to control bus operations & ticket booking.
- Android app & web portal for retail agents to book Zipgo seats *anytime, anywhere*.
- Built internal tools & dashboards for operations personnel to control agent onboarding, seat availability, ticket fares & trip scheduling.

MyBataz

Product Manager

January 2018 - July 2018 (7 months)

Bangalore

myBataz is a performance-based platform where we built a community of Fashion & Lifestyle audiences around Brands through a social media approach.

Over 400,000 installs of the Android app in a span of 3 months from launch. Monetised using AdSense and other ad mediation tools.

Responsible for end to end execution of product lifecycle management starting from market analysis, wireframing, development, launch, operations, digital marketing, sales & revenue.

Used Google analytics, firebase analytics, Clevertap, Feedback loops etc to understand user flows and optimise/improve product flow and user experience, increase retention.

Hired and managed the engineering team of 6 developers to deliver product initiatives. Actively maintained WordPress and the AWS infrastructure.

Via.com

2 years 7 months

Product Manager

March 2017 - December 2017 (10 months)

Bengaluru Area, India

A ~200% increase in organic traffic. Worked closely with Marketing and Engineering to create an automated and robust product to maintain SEO pages for the website across 8 countries and 5 languages.

Worked with various teams like customer support, operations, marketing, business to understand the new initiatives and pain points of the organizations.

Used data from consumer meetings/agent calls/google analytics and in-house data points to get insights about user behaviour.

Responsible for creating Product requirement documents for consumption by engineering, UX Design teams.

UI Developer

June 2015 - March 2017 (1 year 10 months)

Bengaluru Area, India

Experience of managing a team of 4 developers, and handling requirements for UI of multiple products and countries.

Developed UI for products which are live across 9 countries, with 5 languages supported.

Architected an internal system and process to handle all the content in multiple languages, based on Nodejs, Redis, Java.

Apart from Frontend have implemented a deployment and build systems based on Jenkins, GIT and AWS.

Have experience with user engagement tools, strategies, google analytics.

Worked on making a system to create SEO pages in line with the latest strategies, focused mainly on travel.

Worked on nodejs, express, ES6, ReactJs. Deep understanding of REST API.

Campus Diaries

Web Developer

June 2014 - May 2015 (1 year)

Backend developer, Drupal CMS developer, Unit Testing, Agile SCRUM.
In CampusDiaries, I was in the backend team, working majorly with modules for content creation and developing on various modules of Drupal. Learned about deployment cycles and worked with memcache.
